

1. High-Level Architecture

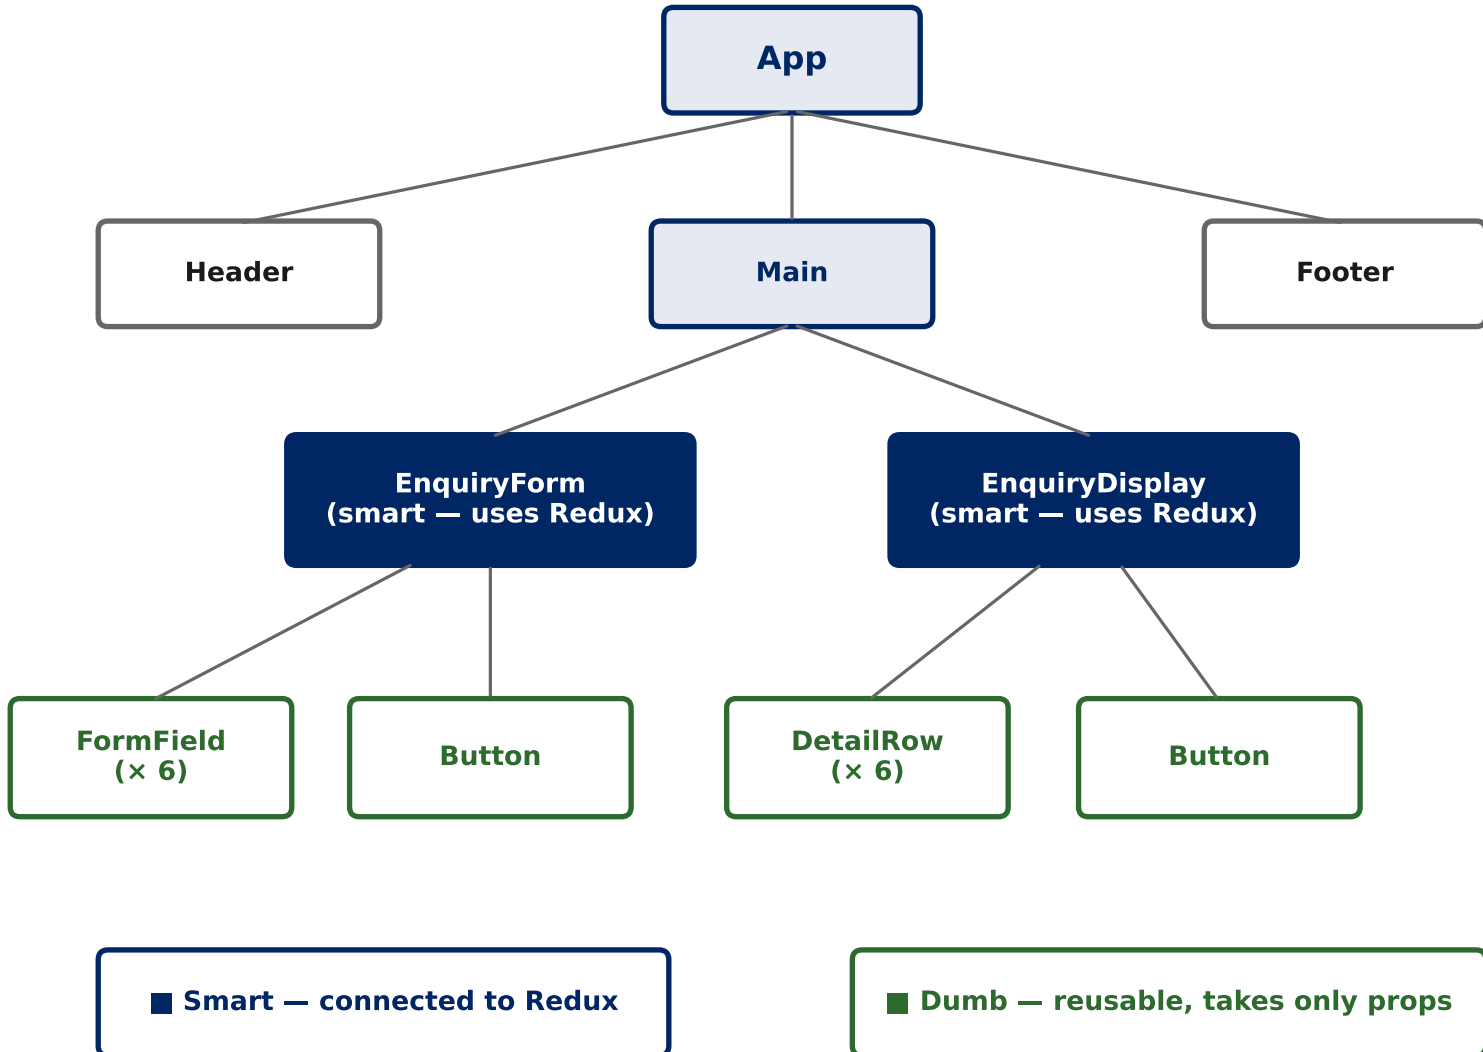

How the pieces of the application fit together

Redux holds the live state. sessionStorage keeps a copy so a page refresh doesn't lose it.

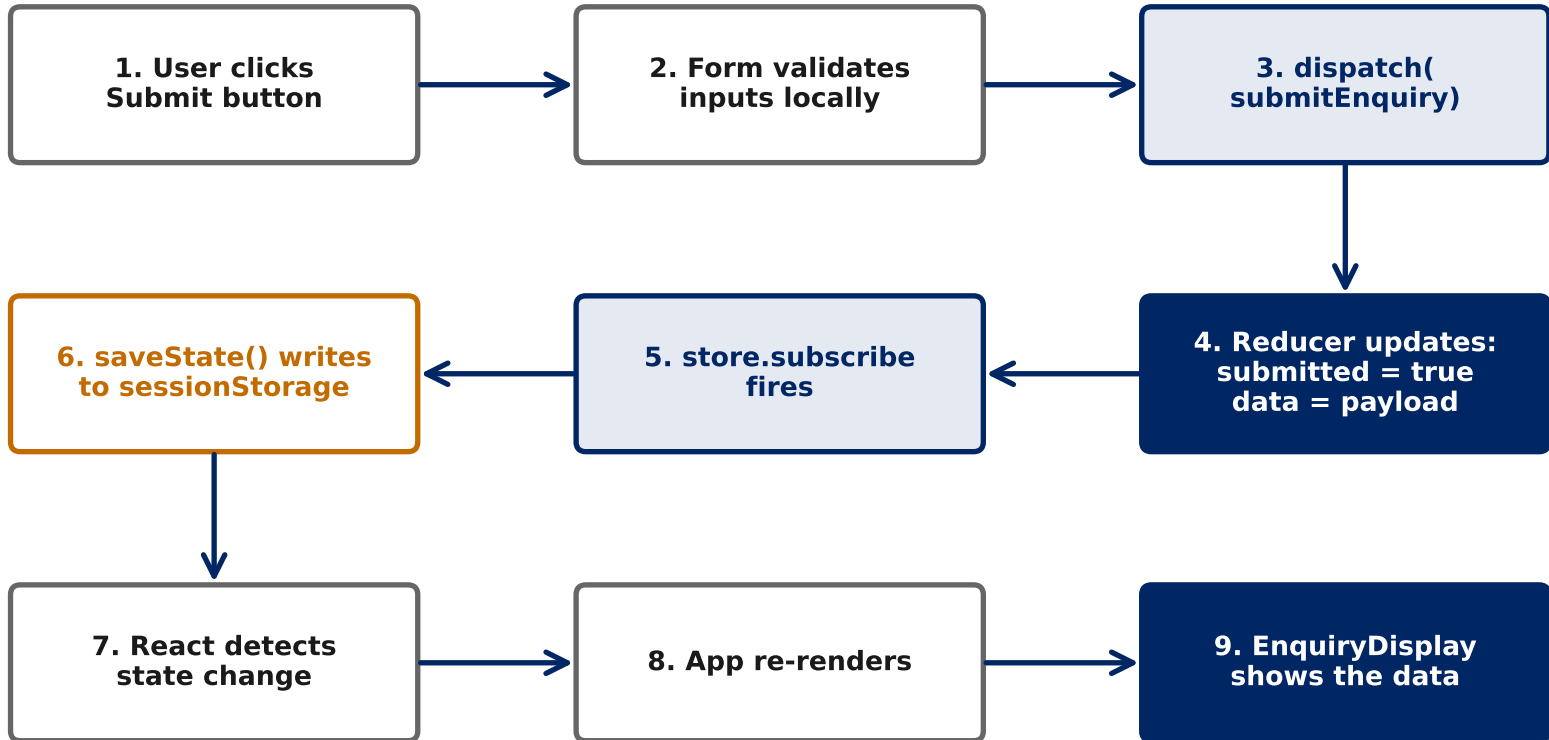

2. Component Tree

Smart components talk to Redux. Dumb components are reusable building blocks.

3. What Happens When You Click Submit

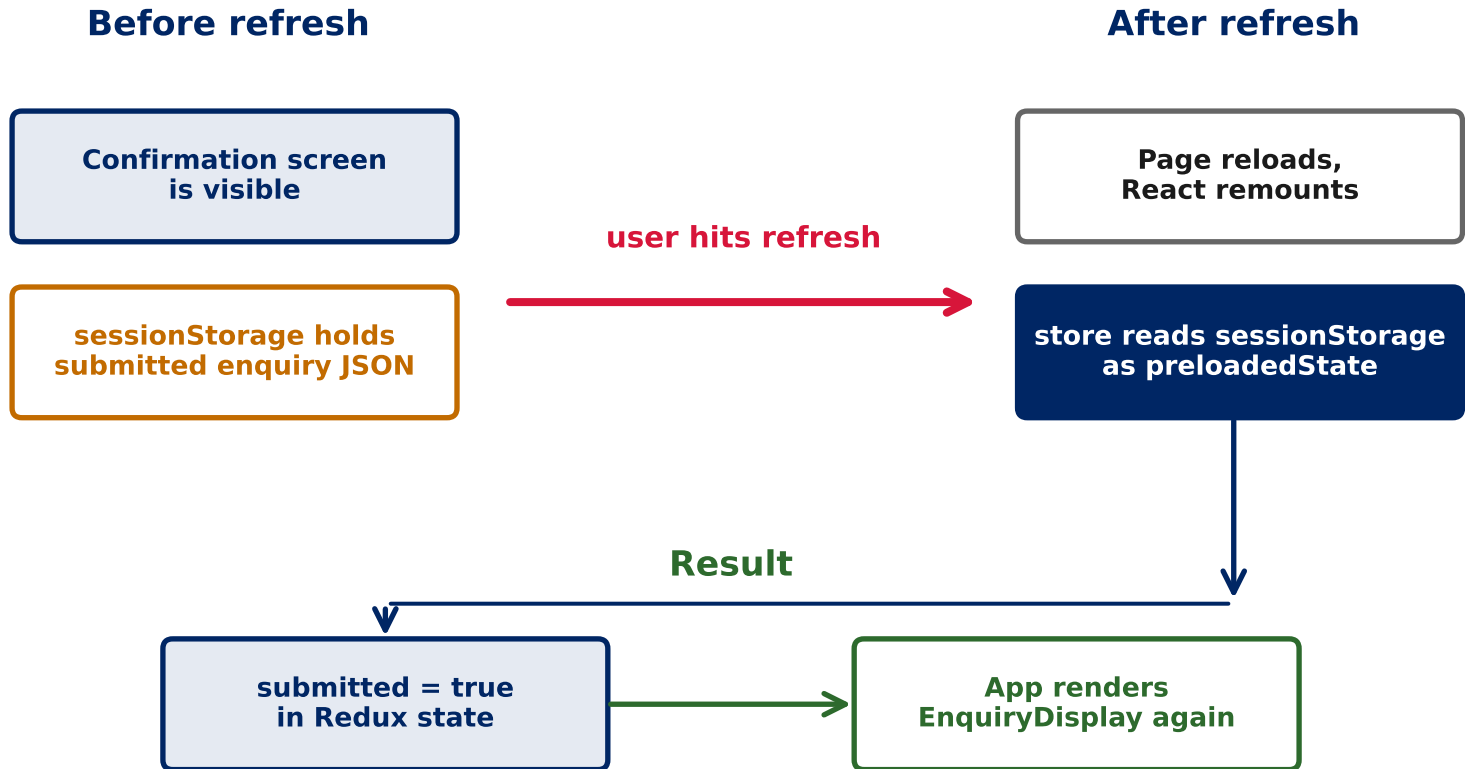

Following one action all the way through the system, step by step

Redux is the source of truth. sessionStorage is the safety net.

4. What Happens When You Refresh the Page

How the submitted state survives a page reload (within the same tab)

Close the tab → sessionStorage clears → data is gone. That's by design.
